11. Cost Structure (Commercial Stage Only)
12. Key Risks & Honest Notes
13. Immediate Next Steps

1. Executive Summary

This plan lays out the full build path for a single app that unifies everything you currently track across separate tools: multiple bank accounts, brokerage and mutual fund holdings (Indian and foreign), insurance policies for you and your family, tax planning, financial goals, and a periodic health report — with an advisor-grade intelligence layer on top rather than just dashboards.

The plan is sequenced deliberately: build for personal use first at zero cost, validate with a small group of real users, then use that working product and your own usage data as the demo asset for fundraising, and only then invest in the paid infrastructure (Account Aggregator, live broker APIs, compliance, billing) that a commercial, multi-user product requires.

Guiding principle

Every module is designed to work in a free, self-hosted form first. Nothing in Stage 1 requires spending money or registering a business. Paid infrastructure is introduced only where it becomes necessary — multi-user scale, iOS parity, live sync — and only after there is either user traction or funding to justify the recurring cost.

2. Product Vision & Positioning

Category: a unified wealth command center for Indian users — closest existing comparables are INDmoney and Kubera, each of which covers part of this scope. The differentiator is the advisor-intelligence layer: a single trustworthy Financial Health Score, coverage-gap analysis, mutual fund overlap detection, and sector look-through — not just more charts.

Primary user

Salaried or self-employed Indian professionals, roughly 25–45, with multiple bank accounts, holdings across more than one broker, some insurance, and moderate tax complexity — a profile close to your own, which is a genuine advantage since you are the first real user.

Core promise

- See true net worth across every account, broker, and asset in one place, automatically.
- Get alerted before something goes wrong — low balance, expiring insurance, off-track goal — rather than discovering it after the fact.
- Receive a periodic, plain-language report on financial health with specific next actions, not just numbers.

3. Staged Roadmap

Four stages, each with a distinct goal, cost profile, and exit criteria before moving to the next.

Stage	Goal	Cost	Exit criteria
1. Personal Build	Fully working app for your own finances	₹0 — self-hosted, on-device	You use it daily without reverting to spreadsheets/old apps
2. Demo to Users	Validate with 5–10 real users	₹0 — same free-tier build	Unprompted repeat usage in week 2 without reminders

Stage	Goal	Cost	Exit criteria
3. Fundraising / Pitch	Prove traction + defensibility to investors	Minimal — pitch deck, data room	Term sheet or committed angel fundi
4. Commercial Launch	Multi-user, compliant, monetized product	AA fees, hosting, legal, licensing	Paying subscribers cover infra cost

4. Functional Modules — Detailed Specification

Seven core modules. Each is listed with its current state (from your existing FinTrack designs), what is net-new, and how it should be built for Stage 1 at zero cost.

4.1 Bank Accounts & Liquidity

- Multi-bank balance and transaction tracking, per-account low-balance threshold alerts.
- Idle-cash detection: flag large sums sitting in low-interest savings for 30+ days.
- Stage 1 data source: SMS parsing on Android (bank-sender templates) + manual entry fallback for iOS/unsupported banks.
- Stage 4 upgrade: Account Aggregator (Setu/Finvu) for real-time multi-bank sync and iOS parity.

4.2 Brokerage, Mutual Funds & Asset Allocation

- Holdings sync across brokers (Upstox, Kite, IndMoney-style), realized and unrealized P&L.
- Asset allocation by type (equity, MF, gold, bonds, cash), by geography (Indian vs foreign ETF/MF), and by sector — including look-through into mutual fund underlying holdings, not just direct stock sector exposure.
- Contribution analysis: how much of total returns came from each instrument type (direct equity vs MF vs ETF).
- Concentration and overlap alerts: sector over-exposure, mutual funds with high portfolio overlap.
- Stage 1 data source: your own CAS (Consolidated Account Statement, CDSL/NSDL) and CAS/CAMS mutual fund statement — both free, monthly, and cover every broker/AMC in one document.
- Stage 4 upgrade: live broker APIs (Kite Connect, Upstox API) for real-time holdings instead of monthly statements.

4.3 Daily Expense & Income Tracking

- Manual entry (existing) plus automatic SMS-derived transactions, merchant categorization, and a review queue so auto-captured entries are confirmed before they affect reports.
- Self-learning categorization: remembers user corrections per merchant.

4.4 Insurance (Self & Family)

- Per-policy tracking — term life, health, motor, personal accident — for the user and each dependent (spouse, parents, children) under a shared Family view.
- Expiry/renewal reminders with configurable lead time (30/15/7 days).
- Coverage-gap analysis: term cover vs income benchmark, health cover vs family size and city-tier medical inflation.
- Data source: manual entry only — no reliable insurer API exists at consumer scale, and this data changes rarely (annually), so manual entry is not a real burden.

4.5 Tax Planning

- Live 80C/80D/80CCD deduction headroom tracked through the financial year, not just a year-end report.
- Capital gains tracking (STCG/LTCG, equity/debt/foreign) computed automatically from Module 4.2 holdings data.

- Old vs new tax regime comparator, recalculated as income/deduction data grows.

4.6 Goals

- Each goal (e.g. house down payment, education, travel) linked to a required monthly SIP and a live on-track/behind status based on actual portfolio growth, not a static progress bar.

4.7 Periodic Financial Health Reports

Generated weekly, monthly, quarterly, half-yearly, and yearly. Each report covers:

- Net worth movement, split into contribution from new savings/investment vs. market growth.
- Spending analysis — category trends and anomalies vs. prior period.
- Investment performance vs. a relevant benchmark index.
- Goal progress — on-track / behind for each active goal.
- Insurance and protection status — expiring policies, coverage gaps.
- Tax position — deductions used vs. headroom remaining.
- 3–5 prioritized, specific recommendations for the period.

5. Financial Health Score — The Differentiator

A single rules-based score (not ML, at least initially) that becomes the app's hero metric — the one number a user checks weekly, with every module feeding into it. This is the core advisor-intelligence feature that separates the product from a generic tracker.

Component	What it measures
Emergency fund adequacy	Months of expenses covered by liquid savings
Debt-to-income ratio	Total EMI/debt obligations vs. income
Savings rate	Percentage of income saved/invested per month
Insurance adequacy	Life cover vs. income; health cover vs. family size
Investment diversification	Spread across asset classes, sectors, and geographies
Goal progress	Percentage of active goals currently on-track

Each component is weighted and combined into a single score, similar in spirit to a credit score — backed by real analysis rather than a vanity number.

6. Technical Architecture

Stage 1 — personal, zero-cost

- Mobile: Flutter, on-device only — no backend server required.
- Local database: Drift (SQLite) — same pattern as your existing Khazana app.
- SMS parsing: on-device only, bank-sender templates stored as versioned local config so parsing rules can be updated without an app release.
- Statement parsing: Python/Node scripts to parse CAS/CAMS PDFs into structured holdings data, run manually or on a schedule.

Stage 4 — commercial, multi-user

- Backend: .NET 9, Clean Architecture, CQRS/MediatR — direct reuse of your current ERP stack experience.
- Database: PostgreSQL for financial records (ACID compliance matters here); Redis for caching computed aggregates (net worth, health score).
- Async processing: RabbitMQ for AA consent webhooks, SMS parsing queue, statement parsing jobs.
- Security: encryption at rest for financial data, tokenized broker credentials via OAuth refresh — never store raw credentials.

7. Data Sourcing — Free vs. Paid, by Module

Module	Free-tier approach	Paid-tier approach
Bank accounts	SMS parsing (Android) + manual entry	Account Aggregator — multi-bank, real-time, iOS-compatible
Brokerage / MF	Own CAS (CDSL/NSDL) + CAMS/KFintech statements, parsed monthly	Live broker APIs (Kite Connect, Upstox) + AA for MF
Insurance	Manual entry	Manual entry — stays the same at every tier; no reliable API exists
Tax / Goals / Reports	Pure calculation on existing data — always free	Deeper what-if modeling, predictive scenarios

For Stage 1 personal use, the fully free stack — SMS parsing, CAS/CAMS statement parsing, manual insurance entry, on-device storage — is not a compromise; it is arguably the better architecture for a single user, since CAS/CAMS statements are more complete (every broker and AMC in one document) than any single paid API would provide.

8. Regulatory & Compliance (Commercial Stage)

These obligations begin only once the product handles other people's financial data commercially — not required for Stage 1 or Stage 2.

- DPDP Act 2023: privacy policy, explicit consent flows, data retention limits, full data-deletion capability on request.
- Account Aggregator / FIU registration: handled through the AA provider's TSP license (Setu/Finvu) with business KYC — no separate RBI license needed.
- SEBI — critical: any feature that suggests specific investment actions (“buy X,” “sell Y”) crosses into regulated investment advice and requires SEBI Registered Investment Advisor status. Keep all suggestions informational and rule-based (“users with similar profiles typically...”) rather than personalized recommendations, unless RIA registration is pursued.
- A registered business entity (sole proprietorship or LLP at minimum) is needed to sign vendor agreements with AA providers, brokers, and a payment gateway.

9. Monetization Strategy

Tier	Indicative price	Includes
Free	₹0	1 bank via SMS, manual brokerage/insurance entry, core reports
Plus	≈ ₹99–199/month	Multi-bank AA sync, live brokerage API, family insurance tracking
Pro	≈ ₹299–499/month	Tax optimization, predictive goal modeling, priority support

Price points are indicative and should be benchmarked against current INDmoney/Kubera pricing before finalizing, since fintech subscription pricing shifts frequently.

10. Development Timeline

Phase	Weeks	Deliverable
Phase 0 — Foundation	1–4	Transaction data model, SMS parsing pipeline, manual entry, core dashboard
Phase 1 — Brokerage & Reports	5–10	CAS/CAMS parsing, asset allocation, P&L, sector look-through, Health Score v1
Phase 2 — Insurance, Tax, Goals	11–16	Insurance tracking with reminders, tax deduction tracker, goal-linked SIP calculator
Stage 2 — Beta Demo	17–19	Onboard 5–10 real users on the free-tier build, collect usage signal
Stage 3 — Fundraising Prep	20–22	Pitch deck, data room, traction summary from beta usage
Phase 3 — Monetization Infra	23–28	Subscription billing, AA integration, live broker APIs, family multi-profile
Phase 4 — Compliance & Launch	29–34	Privacy policy, DPD review, SEBI-safe language audit, security audit, public launch

11. Cost Structure (Commercial Stage Only)

Item	Notes
Account Aggregator (Setu/Finvu)	Per-pull charges plus possible onboarding fee — confirm current quotes directly before committing
Kite Connect API	Small recurring subscription per Zerodha's published developer pricing
Backend hosting	Free tiers (Azure/Render/Railway/Supabase) sufficient until real user scale
Business registration & legal review	One-time — do not skip legal review of privacy policy and advisory language, given SEBI exposure
App store fees	One-time: \$25 Android; \$99/year iOS

12. Key Risks & Honest Notes

- Competitive intensity: INDmoney and Kubera are well-funded incumbents. The realistic pitch is a sharper wedge (advisor-intelligence) or an eventual acquisition path, not out-scaling them directly — worth being clear-eyed about this when framing the fundraising ask.
- SEBI exposure is the single biggest regulatory risk in this product category — any advisory language must be reviewed carefully before commercial launch.
- SMS/notification-based capture is Android-only by OS policy (Apple blocks SMS access outright) — CAS/CAMS statement upload and email parsing are the practical cross-platform and iOS paths.
- Parsing accuracy will not be perfect on day one across every bank format — the review/confirm queue is what protects data integrity and user trust while coverage improves.

13. Immediate Next Steps

- Finalize the transaction data model (add source, confidence_score, is_reviewed fields) — this is the foundation every other module depends on.
- Build the SMS parsing pipeline for your own banks first — fastest path to a genuinely useful daily-use app.
- Pull your own CAS and CAMS statements and build the parser — unlocks the full brokerage/MF module at zero cost.
- Define the Financial Health Score formula and weights in detail before building the reports module, since it is the feature every later pitch and report depends on.
